This book defends the view that any adequate account of rational decision making must take a decision maker's beliefs about causal relations into account. The early chapters of the book introduce the non-specialist to the rudiments of expected utility theory. The major technical advance offered by the book is a 'representation theorem' that shows that both causal decision theory and its main rival, Richard Jeffrey's logic of decision, are both instances of a more general conditional decision ...

The causal decision theory originated with some strikingly convincing counterexamples to the noncausal formulation of the principle of maximizing expected utility (PMEU). Suppose P needs to decide whether (G) to go to graduate school, and then become a university professor, or (B) to become a professional baseball player.

Causal decision theory adopts principles of rational choice that attend to an act's consequences. It maintains that an account of rational choice must use causality to identify the considerations that make a choice rational.

Cost-sensitive and causal classification methods have independently been proposed to improve the performance of classification models. The former considers the benefits and costs of correct and incorrect classifications, such as the benefit of a retained customer, whereas the latter estimates the causal effect of an action, such as a retention campaign, on the outcome of interest.

The Foundations of Causal Decision Theory. The Foundations of Causal Decision Theory Fitelson, Branden In it Grice is not interested in distinguishing the categories of value or the good from reasons, nor in exploring their relations to desirability, to wanting or to intending. Some of the relevant questions were explored by him in *The Conception of Value* (Oxford: Oxford University Press, 1991), based on his 1983 Carus lectures.

Evidential decision theory is a school of thought within decision theory according to which the best action is the one which, conditional on one's having chosen it, gives one the best expectations for the outcome. It contrasts with causal decision theory, which requires a causal connection between one's actions and the desirable outcome.
