9. Shear Lug Design Normally, friction and the shear capacity of the anchors used in a foundation adequately resist column base shear forces. In some cases, however, the engineer may find the shear force too great and may be required to transfer the excess shear force to the foundation by another means.

There has recently been a discussion in my office regarding the adequacy of using a shear lug at a moment frame base plate. Some think that they cannot adequately transfer the shear and that there are flaws in the design methods for shear lugs. I have tried doing research on the topic and have found very little data.
