Electrical power equipment maintenance is a combination of common sense and highly technical activities around and inside high-energy equipment with a downside potential for disastrous results. Power equipment often needs planned shutdowns for much of the important required maintenance, and continually deferring maintenance because the shutdowns are too hard is a risky proposition in its own right.

Planned maintenance can be carried out on the basis of the operation of the piece of electrical equipment itself. For example, it is worth considering whether all electric motors should be periodically cleaned and inspected, making sure that dirt and dust has not interfered with the self cooling of the motor and that there is no oil leakage into the motor’ s windings.
