One of the causes of the creation of such transients is that of Lightning. Their mode of action is usually indirect and exerts it through affecting the power line. They generate induced transients by coupling into the power system. Another cause is that of the routine utility tasks which include:

What are Transients & How to eliminate them from Power System?

Electrical transients are momentary bursts of energy induced upon power, data, or communication lines. They are characterized by extremely high voltages that drive tremendous amounts of current into an electrical circuit for a few millionths, up to a few thousandths, of a second. Large transients on the power system originating outside of a facility are best initially diverted at the service entrance of a facility.

A transient event is a short-lived burst of energy in a system caused by a sudden change of state. The source of the transient energy may be an internal event or a nearby event. The energy then couples to other parts of the system, typically appearing as a short burst of oscillation.

Transient (oscillation) - Wikipedia

Transients are power quality disturbances that involve destructive high magnitudes of current and voltage or even both. It may reach thousands of volts and amps even in low voltage systems. However, such phenomena only exist in a very short duration from less than 50 nanoseconds to as long as 50 milliseconds.
