Element # 10. Tailrace: The water after having done its useful work in the turbine is discharged to the tailrace which may lead it to the same stream or to another one. The design and size of tailrace should be such that water has a free exit and the jet of water, after it leaves the turbine, has unimpeded passage. Element # 11. Draft Tubes:

Generation or Generating Station The place where electric power produced by the parallel connected three phase alternators/generators is called Generating Station (i.e. power plant). The ordinary power plant capacity and generating voltage may be 11kV, 11.5 kV 12kV or 13kV.

Electric Power System - Generation, Transmission ...

Power from generation plants is carried first through transmission systems, which consist of transmission lines that carry electric power at various voltage levels. A transmission system corresponds to a networked, meshed topology infrastructure, connecting generation and substations together into a grid that usually is defined at 100 kV or more.

Nuclear Power Station Nuclear power plants are similar to thermal stations in more ways than one. However, the exception here is that radioactive elements like uranium and thorium are used as the primary fuel in place of coal. Also in a Nuclear station, the furnace and the boiler are replaced by the nuclear reactor and the heat exchanger tubes.

Power Plant: What Are They? (& the Types of Power Plants)

Electrical energy, after being produced at generating stations (TPS, HPS, NPS, etc.) is transmitted to the consumers for utilization. This is due to the fact that generating stations are usually situated away from the load centers. The network that transmits and delivers power from the producers to the consumers is called the transmission system. This energy can be transmitted in AC or DC form.
