Chemical energy of the fuel is first converted to thermal energy by means of combustion or oxidation with air inside the engine, raising the T and p of the gases within the combustion chamber. The high-pressure gas then expands and by mechanical mechanisms rotates the crankshaft, which is the output of the engine.

Engine Construction Principles Of Operation Chapter 4

Usually, automobile engines make use of four strokes to turn chemical energy into mechanical energy with the help of combustion of gases or hydrocarbon fuel. Principle of Operation-. In the spark ignition engine an Air/Fuel mixture is formed outside the combustion

Chapter 3 Construction of an Internal Combustion Engine

The principle of operation of the spark ignition (SI) engines was invented by Nicolaus A. Otto in the year 1876; hence SI engine is also called the Otto engine. The principle of working of compression ignition engine (CI) was found out by Rudolf Diesel in the year 1892, hence CI
